MathWorks AUTOMOTIVE CONFERENCE 2023 Europe

Targeting GPUs for Automotive Applications

Christoph Stockhammer, MathWorks

Key Takeaways

Accelerate MATLAB & Simulink simulations

Deploy algorithms (signal/deep learning,...) to embedded GPUs

Types of GPUs

Desktop GPUs (and Cloud GPUs)

Embedded GPUs

CUDA code generation

- Generate optimized CUDA code from MATLAB and Simulink for deep learning, embedded vision, and autonomous systems
- Generated CUDA is <u>portable</u> across NVIDIA desktop GPUs
- Prototype algorithms on modern GPUs including the A100/ V100 and Jetson AGX Orin
- Accelerate computationally intensive portions of your MATLAB code and Simulink models using generated CUDA code

Why Use CUDA code generation ?

Pains: Hand code

- Cannot code in CUDA
- Time consuming
- Manual Coding Errors
- Multiple implementations
- Expensive

Solution: GPU Coder

- Automatically convert to CUDA
- Get to CUDA faster
- Eliminate manual coding errors
- Maintain Single "Truth"
- Stay within MATLAB/Simulink at a higher level

Two Application examples today

1) Fog Rectification

2) Lidar point cloud segmentation

F71

Analyze CPU/GPU interaction for performance improvements

Code Profiling using GPU Performance Analyzer

CPU Activities

CPU Overhead: 23%

Wait for GPU

Overhead

- Profile and understand GPU and CPU activities, events, and performance metrics in a chronological timeline plot
- Use the profiling info to analyze and optimize the performance of the generated CUDA
- Visualize code metrics and identify optimization and tuning opportunities

Optimizations for Generated CUDA Code

- Accelerated library support
 - cuFFT, cuBLAS, cuSolver, Thrust, cuDNN, & TensorRT
- Data Transfer Minimization
 - Analyzes data dependency between the CPU and GPU partitions to determine minimum set of locations where data must be copied between CPU and GPU using cudaMemcpy
