# Improving the Reliability of Vehicle Electronic Control Component Validation using MATLAB XCP Communication.

*SeYoung Noh, HL MANDO*

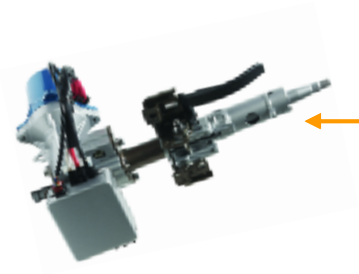

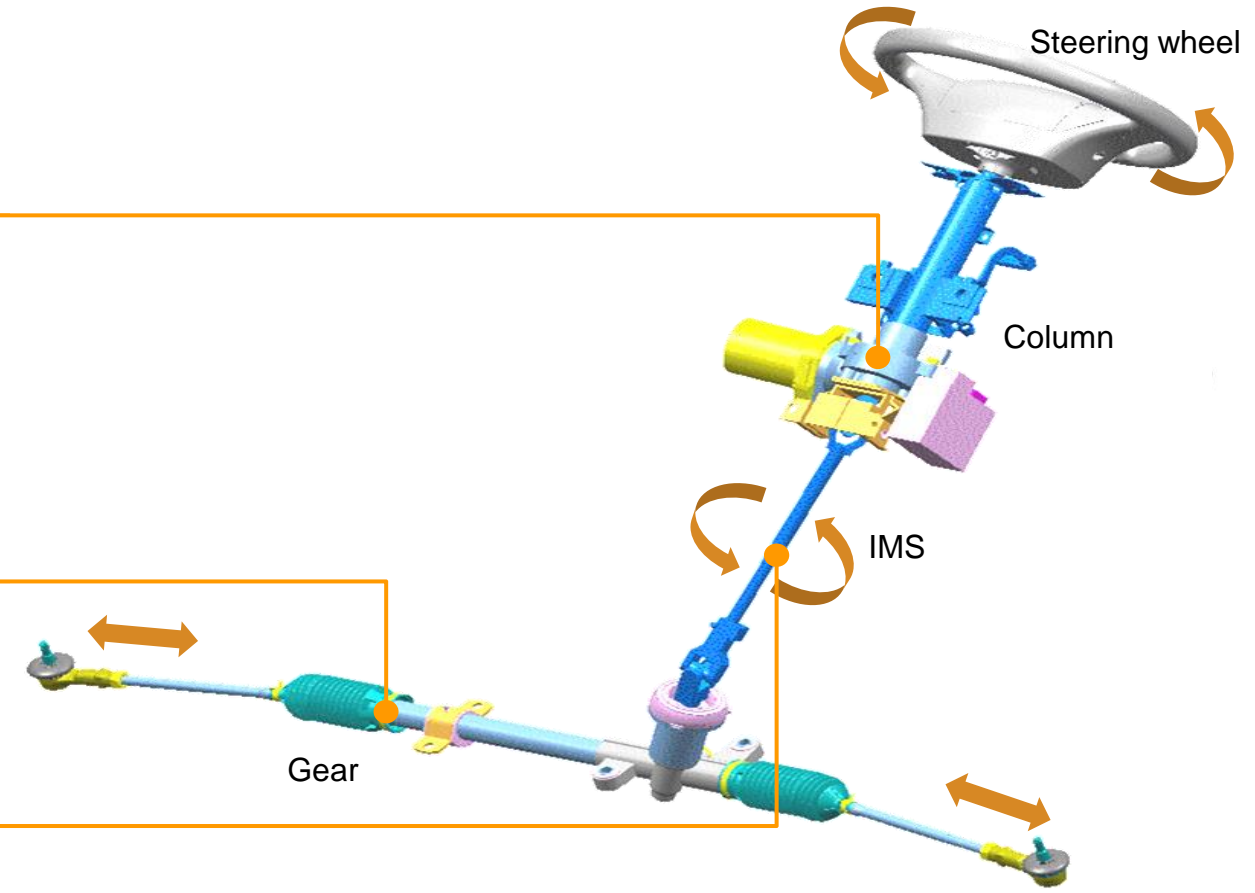

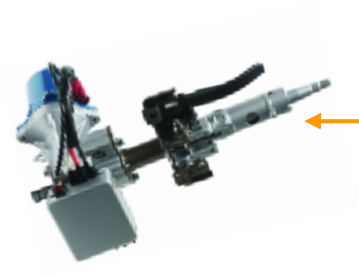

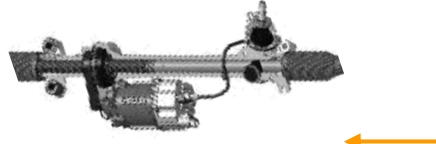

# Contents

1. Introduction to products and presenter
2. Background
3. Challenges in Electronic Verification Testing of Car Components
4. Solutions Through MATLAB Vehicle Network Toolbox
5. Results using XCP Monitoring
6. Further Details on Solutions Adopted
7. Conclusion

# Introduction to HL MANDO Steering Products

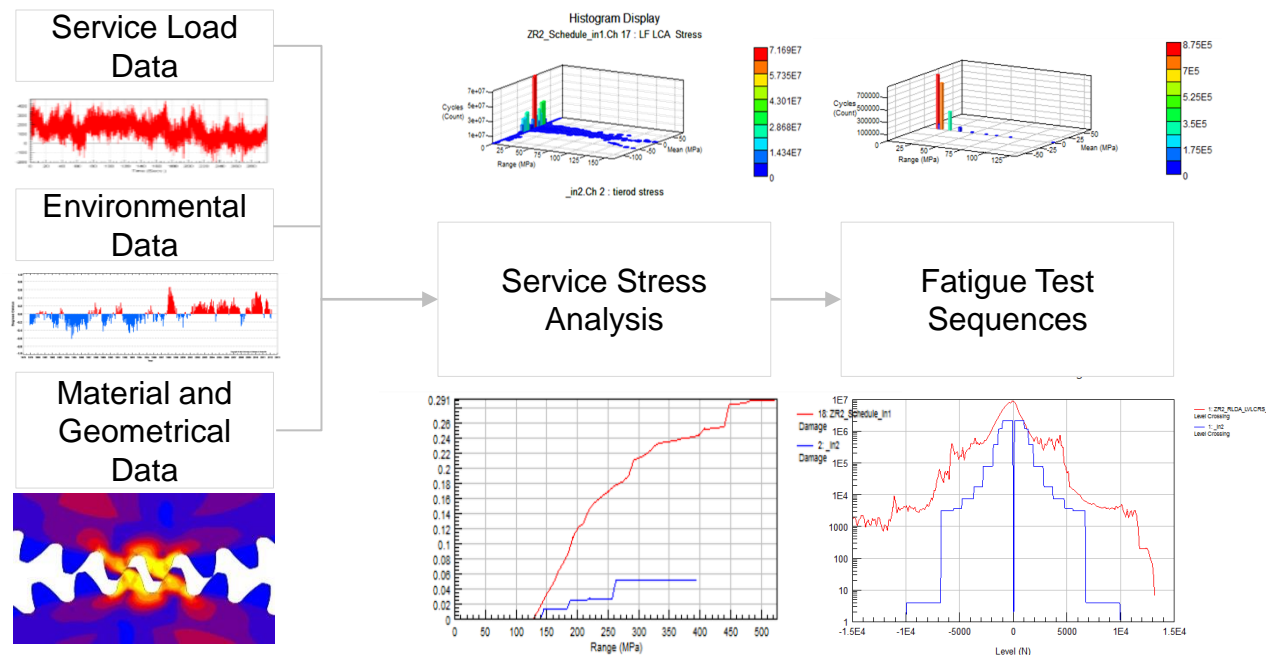

- The presenter handles column section research and development

Section	Product	Picture	
Column	✓ C-EPS		 <p>Steering wheel</p> <p>Column</p> <p>IMS</p> <p>Gear</p>
	✓ SFA		
Gear	R-EPS		
	RWA		
-	IMS		

# Introduction to Presenter & Rig Test

- Presenter
  - Senior Research Engineer / HL MANDO
  - Rig Test Engineer / Column & IMS (2012 – Present)
- Testing Technology

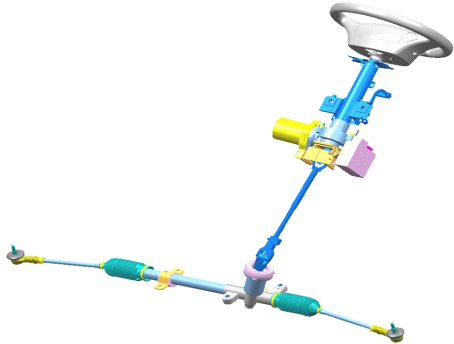

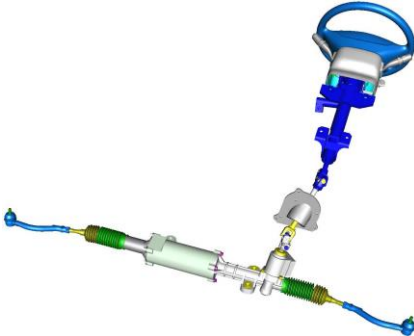

Real Vehicle Test Condition Analysis

Rig Test Application

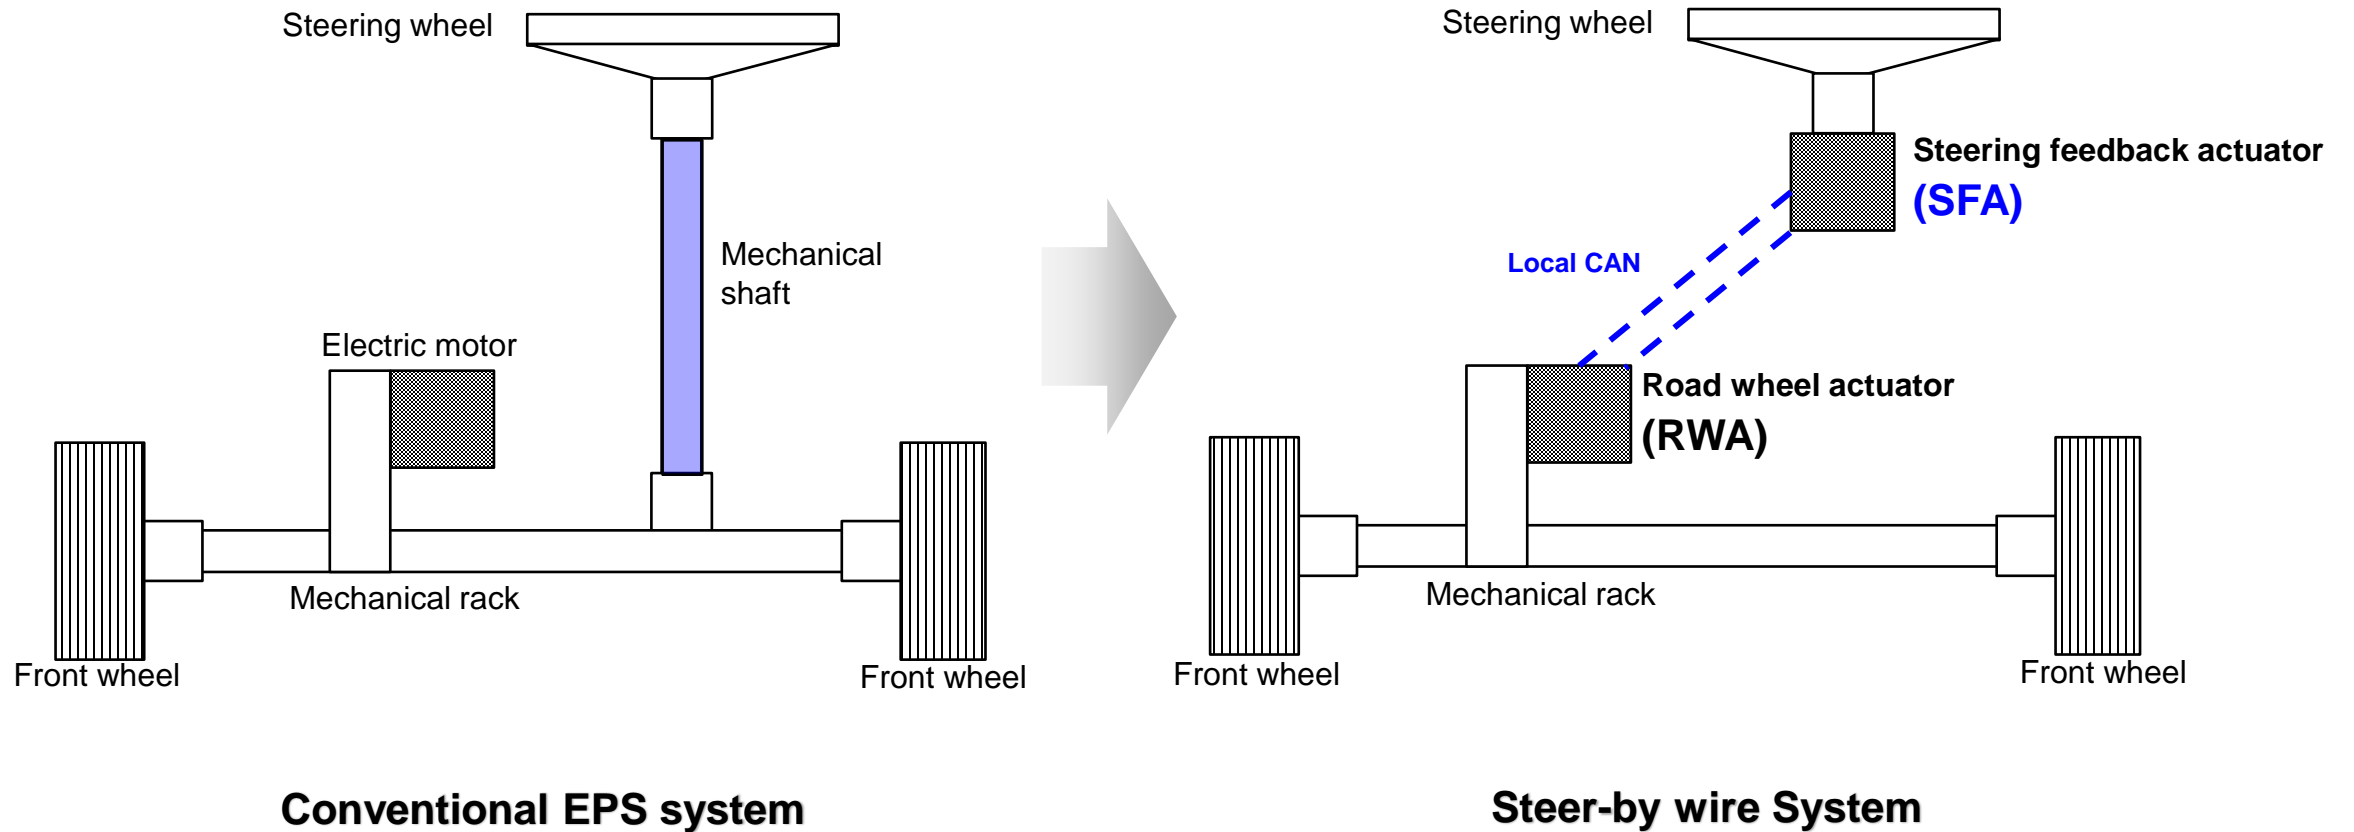

# Background

- Due to advancements in automotive control technology, vehicle components are undergoing electrification and automation.

	2010	2015	2020
Vehicle			
	Conventional	Hybrid & Electric	Autonomous
Steering System			
	Column Type Electric Power	Rack Type Electric Power	Steer-By Wire

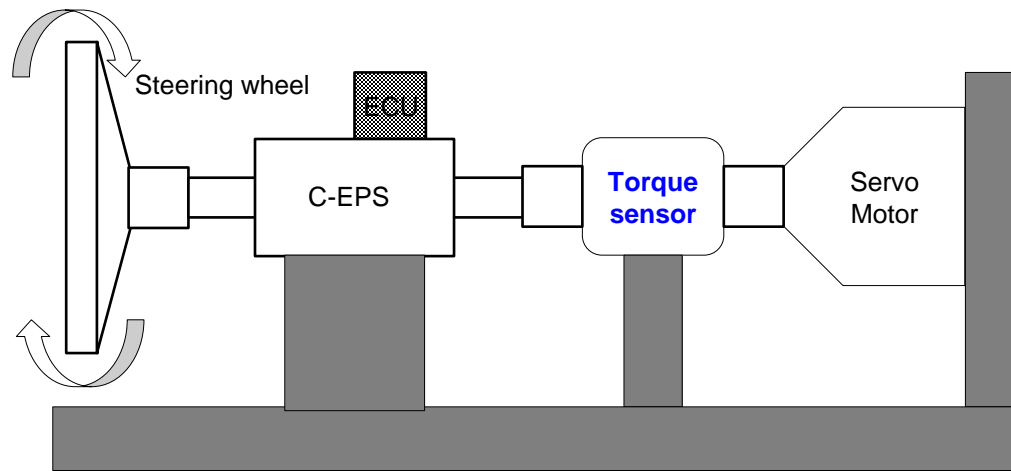

# Background

- Rack and wheel are connected by Local CAN instead of Mechanical shaft

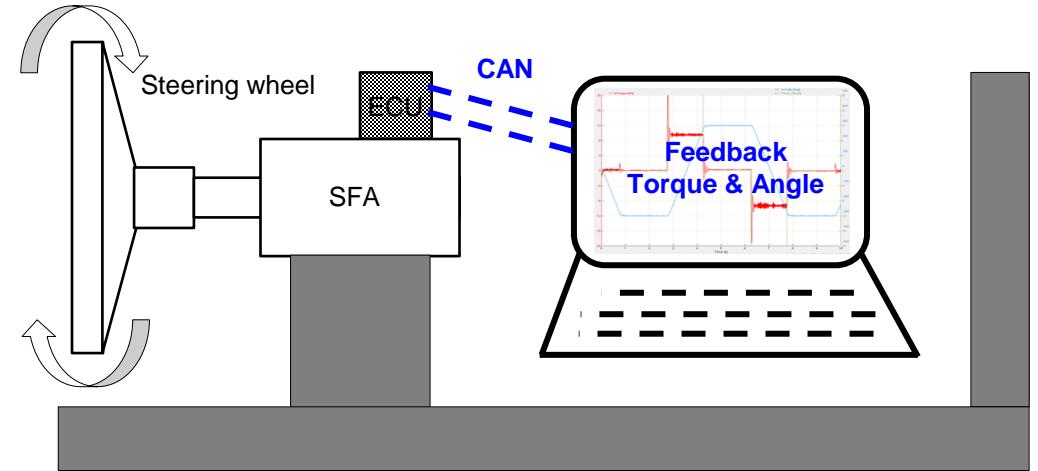

# Challenges in Electronic Verification Testing

- As the product evolves, it is necessary to measure data using CAN

**Column Type Electric Power Steering**

**Steering Feedback Actuator**

# Challenges in Electronic Verification Testing

- CAN Signals measurement is required, causing problems such as difficulty and cost

## 1. Measurement of CAN Signals Required

- No mechanical connection, CAN measurement required
- User Torque, Angle → Feedback Torque, Angle

## 2. Difficulty in Identifying Causes of Issues

- Increased number of electronic and control devices
- Invisible control problems occur

## 3. Increased Measurement Cost

- Requires additional CAN measurement equipment
- Software costs required for CAN measurements

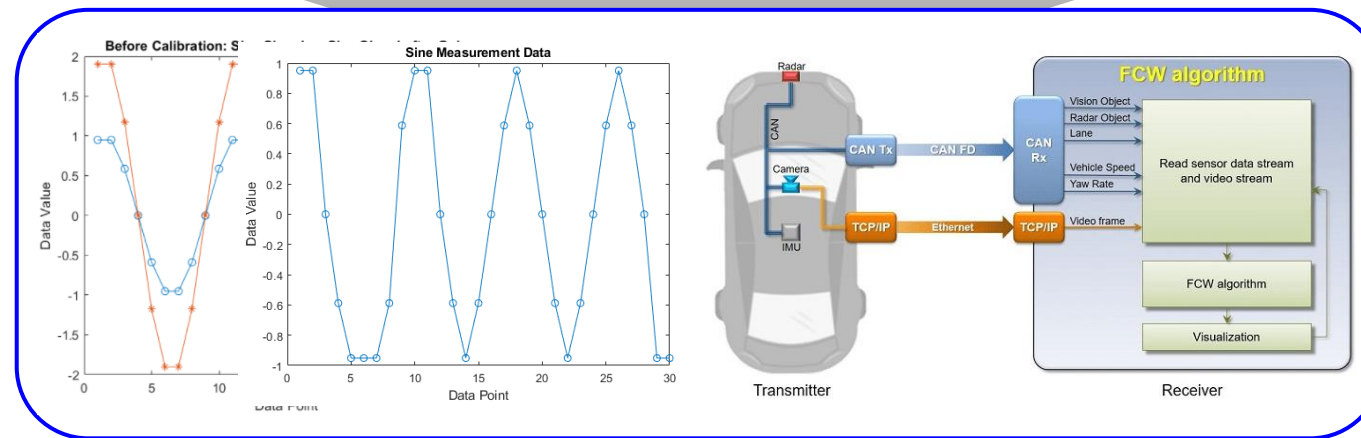

# Solutions and Results Through MATLAB Vehicle Network Toolbox

- Solving the waste of repetitive intermediate inspection using Vehicle Network Toolbox

## MATLAB Vehicle Network Toolbox

# Solutions and Results Through MATLAB Vehicle Network Toolbox

- Vehicle Network Toolbox

- ✓ CAN and CAN FD Communication

- Vehicle network communication using CAN or CAN FD protocol

- ✓ XCP Communication over CAN or XCP or Ethernet

- Vehicle network communication using XCP protocol

- J1939 Communication

- Vehicle network communication using J1939 protocol

- Standard File Formats

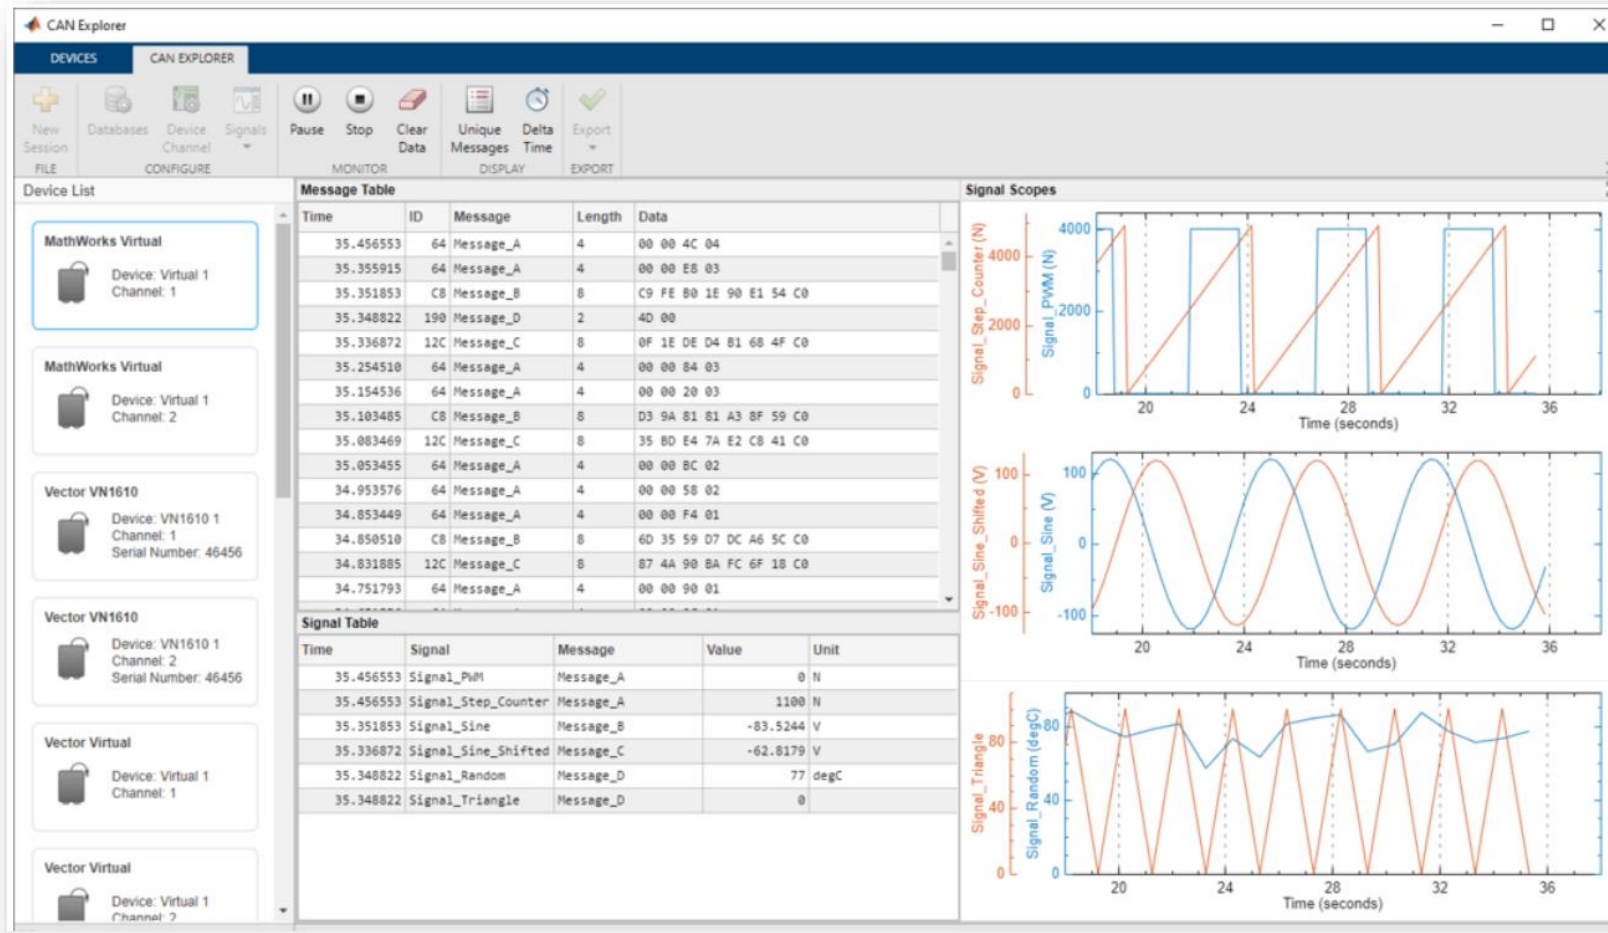

- Access measurement data format (MDF), ASAM calibration data format (CDF), and binary logging format (BLF) files

- Vehicle Network Toolbox Supported Hardware

- Support for third-party hardware (Vector, Kvaser, NI, PEAK Systems)

# Solutions and Results Through MATLAB Vehicle Network Toolbox

- CAN and CAN FD Communication

# Solutions and Results Through MATLAB Vehicle Network Toolbox

- XCP Communication
- Features
  - Measurement
  - Calibration
- Value for Vehicle Network Toolbox XCP
  - Low-cost access to calibration and measurement workflows
  - Single environment tools
  - Growing element of MBD workflow
  - Model based and actual ECU calibration

# Solutions and Results Through MATLAB Vehicle Network Toolbox

- Physical & Virtual Connectivity
- Vehicle Network Toolbox(VNT) uses CAN or CAN FD in physical or virtual modes
- Physical connection to external bus via 3<sup>rd</sup> party device
- Virtual connection to build models for desktop simulation
- Virtual device developed in-house shipped in VNT (plus 3<sup>rd</sup> party)
  - Use VNT without 3<sup>rd</sup> party dependency or driver install

```
C:\Matlab\XCPsim1\XCPsim.exe
XCPsim ECU simulator for Ethernet or CAN (Basic Version)
Vector Informatik GmbH, 2004

Build Aug 10 2010 12:25:37

CALRAM_ADDR = 0x004B5024
CALRAM_SIZE = 0x000001C1
```

# Solutions and Results Through MATLAB Vehicle Network Toolbox

## ■ XCP Real Time Monitoring Program

### 1. XCP Signal Monitoring is Feasible

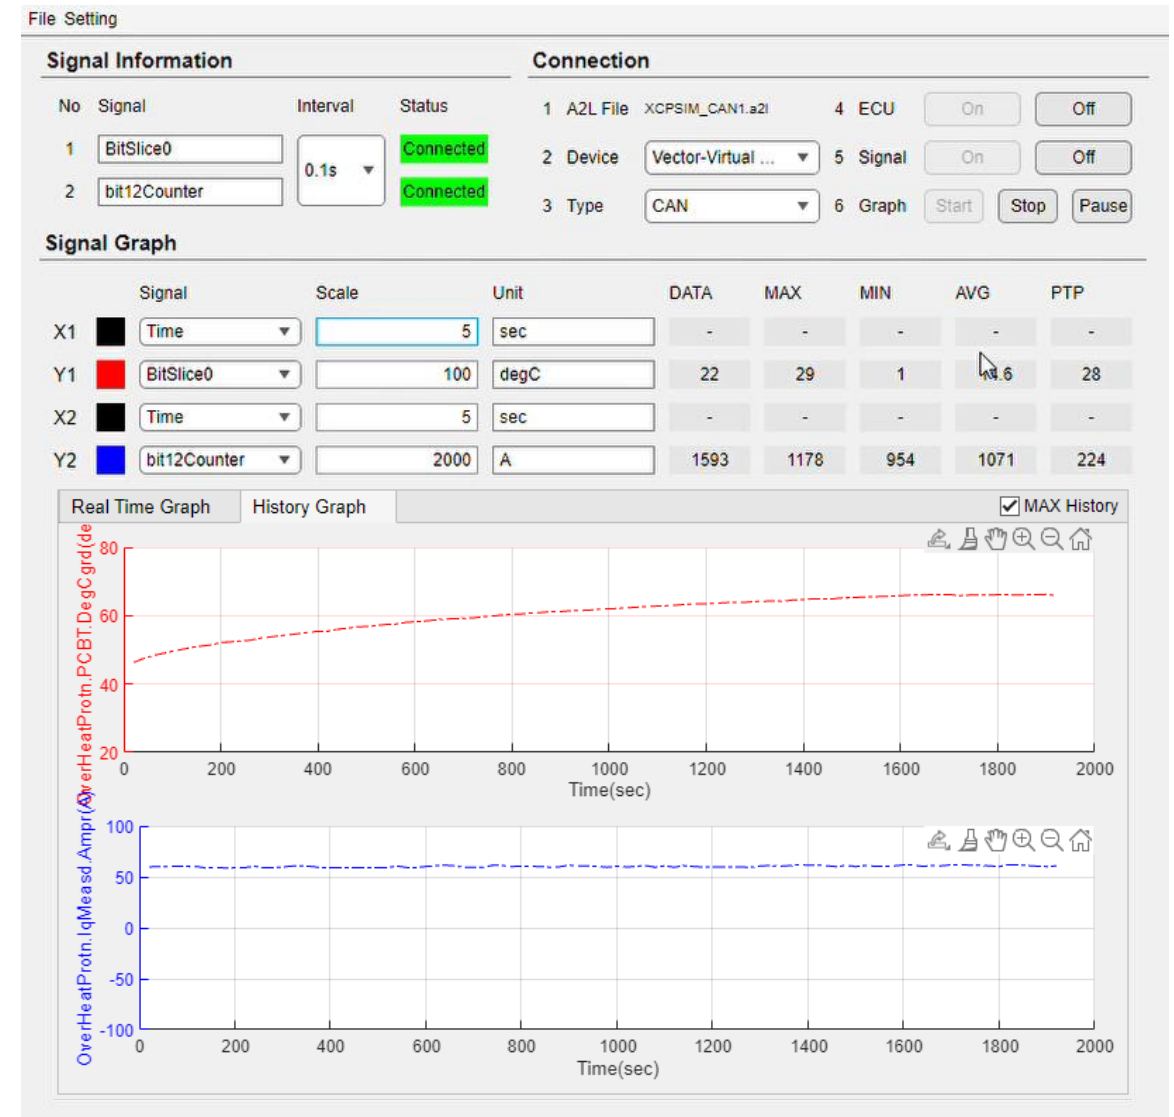

- Utilizing A2L Files for Convenient Usage
- Flexibility to Set Multiple Signals and Intervals
- Various Equipment such as CAN-FD and CAN

### 2. Continuous 24-Hour Real-time Logging

- Ability to Determine Occurrence Time and Analysis
- Data Analysis Enables Trend Identification

### 3. Cost Savings and Convenience

- Cost Savings through In-House Program Coding
- Enhanced Convenience via MATLAB Integration

# Solutions and Results Through MATLAB Vehicle Network Toolbox

## Introduction to Key Code for XCP Monitoring

### Link to an A2L File

#### Link to an A2L File

Create an A2L file object.

```
a2lfile = xcpA2L('XCPSIM.a2l')
```

a2lfile =

A2L with properties:

File Details

```
FileName: 'XCPSIM.a2l'
FilePath: 'c:\XCPSIM.a2l'
ServerName: 'CPP'
Warnings: [0x0 string]
```

Parameter Details

```
Events: {1x6 cell}
EventInfo: [1x6 xcp.a2l.Event]
Measurements: {1x45 cell}
MeasurementInfo: [45x1 containers.Map]
Characteristics: {1x16 cell}
CharacteristicInfo: [16x1 containers.Map]
AxisInfo: [1x1 containers.Map]
RecordLayouts: [41x1 containers.Map]
CompuMethods: [15x1 containers.Map]
CompuTabs: [0x1 containers.Map]
CompuVTabs: [2x1 containers.Map]
```

XCP Protocol Details

```
ProtocolLayerInfo: [1x1 xcp.a2l.ProtocolLayer]
DAQInfo: [1x1 xcp.a2l.DAQ]
TransportLayerCANInfo: [1x1 xcp.a2l.XCPonCAN]
TransportLayerUDPInfo: [1x1 xcp.a2l.XCPonIP]
TransportLayerTCPInfo: [0x0 xcp.a2l.XCPonIP]
```

### Create an XCP Channel

#### Create an XCP Channel Using a CAN Server Module

Create an XCP channel using a Vector CAN module virtual channel.

Link an A2L file to your session.

```
a2l = xcpA2L("XCPSIM.a2l");
```

Create an XCP channel.

```
xcpch = xcpChannel(a2l,"CAN","Vector","Virtual 1",1)
```

xcpch =

Channel with properties:

```
ServerName: 'CPP'
A2LFileName: 'XCPSIM.a2l'
TransportLayer: 'CAN'
TransportLayerDevice: [1x1 struct]
SeedKeyDLL: []
```

#### Create an XCP Channel for Ethernet

Create an XCP channel for TCP communication via Ethernet.

Link an A2L file to your session.

```
a2l = xcpA2L("XCPSIM.a2l");
```

Create an XCP channel.

```
xcpch = xcpChannel(a2l,"TCP","10.255.255.255",80)
```

### Connect & Measurement

#### Connect to a Server Module

Create an XCP channel connected to a Vector CAN device on a virtual channel and connect it.

Link an A2L file to and create an XCP channel with it.

```
a2lfile = xcpA2L('XCPSIM.a2l')
xcpch = xcpChannel(a2lfile,'CAN','Vector','Virtual 1',1);
```

Connect the channel and verify that it is connected.

```
connect(xcpch)
isConnected(xcpch)
```

#### Read Value from XCP Channel Measurement

Read the value from an XCP channel measurement, identifying the measurement by name.

```
a2lObj = xcpA2L('myA2Lfile.a2l');
chanObj = xcpChannel(a2lObj,'CAN','Vector','Virtual 1',1);
connect(chanObj);
value = readMeasurement(chanObj,'limit')
```

100

Alternatively, create a measurement object and read its value.

```
measObj = a2lObj.MeasurementInfo('limit');
value = readMeasurement(chanObj,measObj)
```

100

# Results using XCP Monitoring

- Example 1.
  - Test Equipment Setup

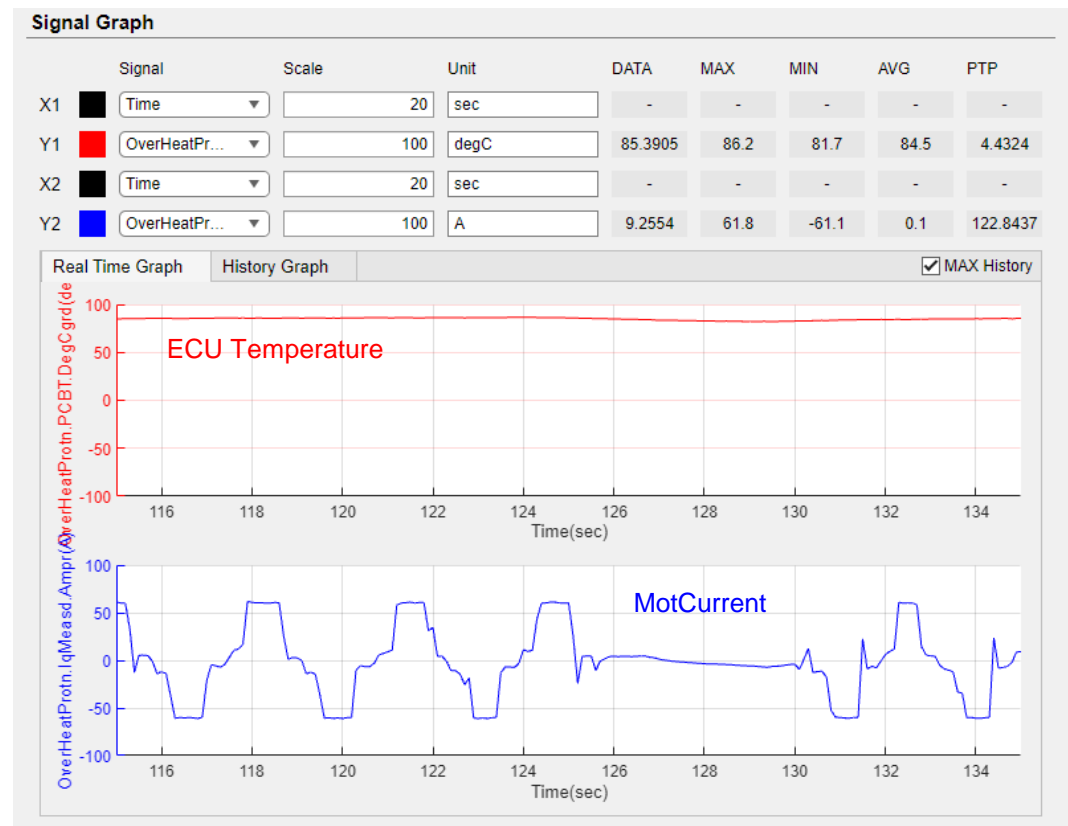

# Results using XCP Monitoring

- Example 1.
  - Optimal Test Interval Determination via ECU Temperature and Motor Current Monitoring

## 1. Test Condition

- Test Equipment : Endurance Tester
- Angle :  $\pm 180\text{deg}$ , Sine Wave,  $360\text{deg/sec}$
- Torque : SFA MAX Torque Square Wave
- Operate Cycle : 5~10 Cycle (TBD)
- Wait Time : 5~20 sec (TBD)
- Need to find the Operate Cycle and Wait time

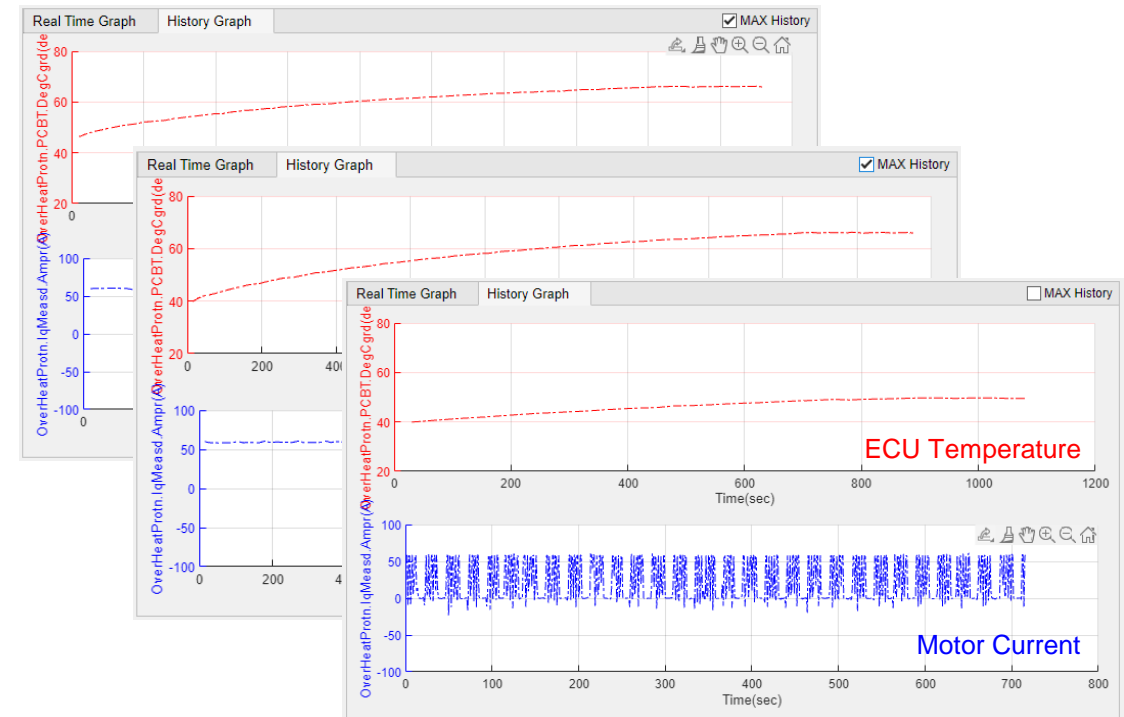

# Results using XCP Monitoring

- Example 1.
  - Optimal Test Interval Determination via ECU Temperature and Motor Current Monitoring

## 2. Test Result

- Setting the Wait Time to 20 seconds is reasonable.

Operate (Cycle)	Wait Time (sec)	MAX Temp (°C)	Result
Criteria	TBD	MAX 55	
5	5	66	Over Temp
5	10	65	Over Temp
5	20	50	Acceptable
10	5	72	Over Temp
10	10	68	Over Temp
10	20	62	Over Temp

# Results using XCP Monitoring

- Example 2.
  - Test Equipment Setup

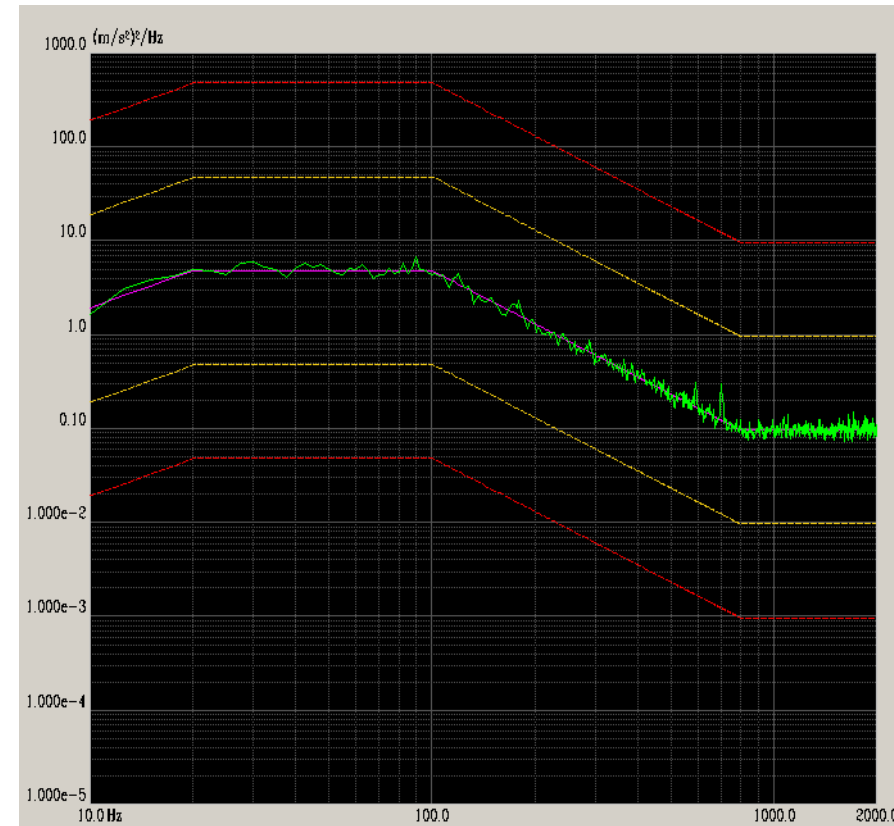

# Results using XCP Monitoring

- Example 2.
  - Validation of Sensor Error During Complex Environmental Vibration Test

## 1. Test Condition

- Test Equipment : Vibration Tester
- Chamber Temperature : -40 ~ 85°C (12hr, Cycle)
- Frequency : Refer to below the graph
- No abnormalities in torque signal expected

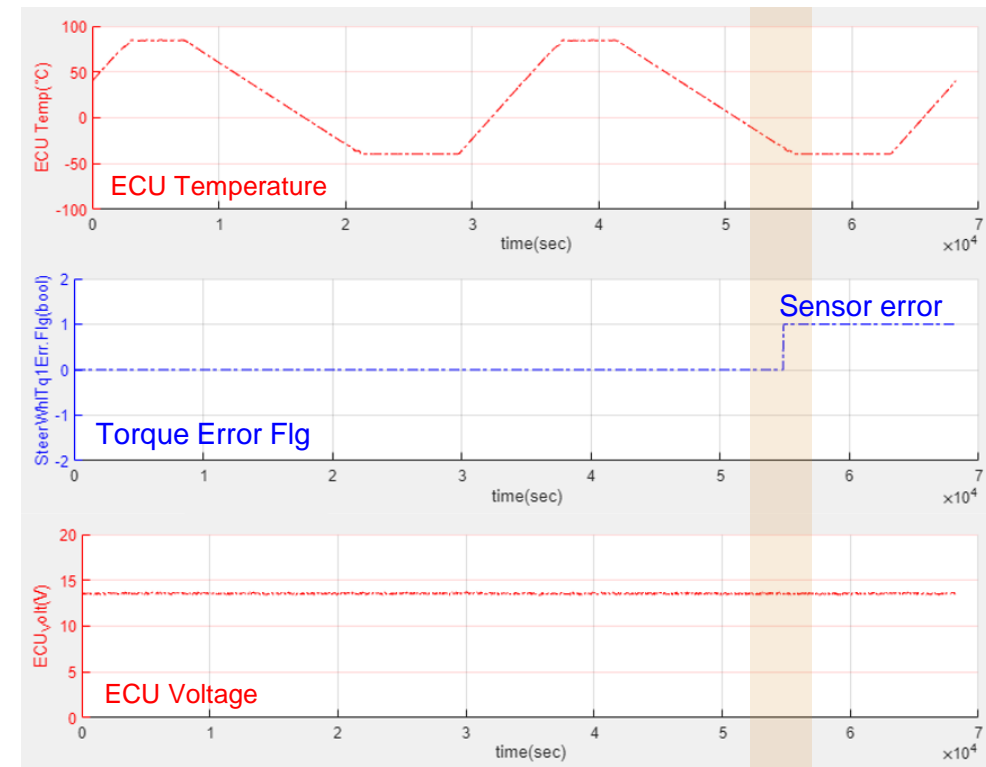

# Results using XCP Monitoring

- Example 2.
  - Validation of Sensor Error During Complex Environmental Vibration Test

## 2. Test Result

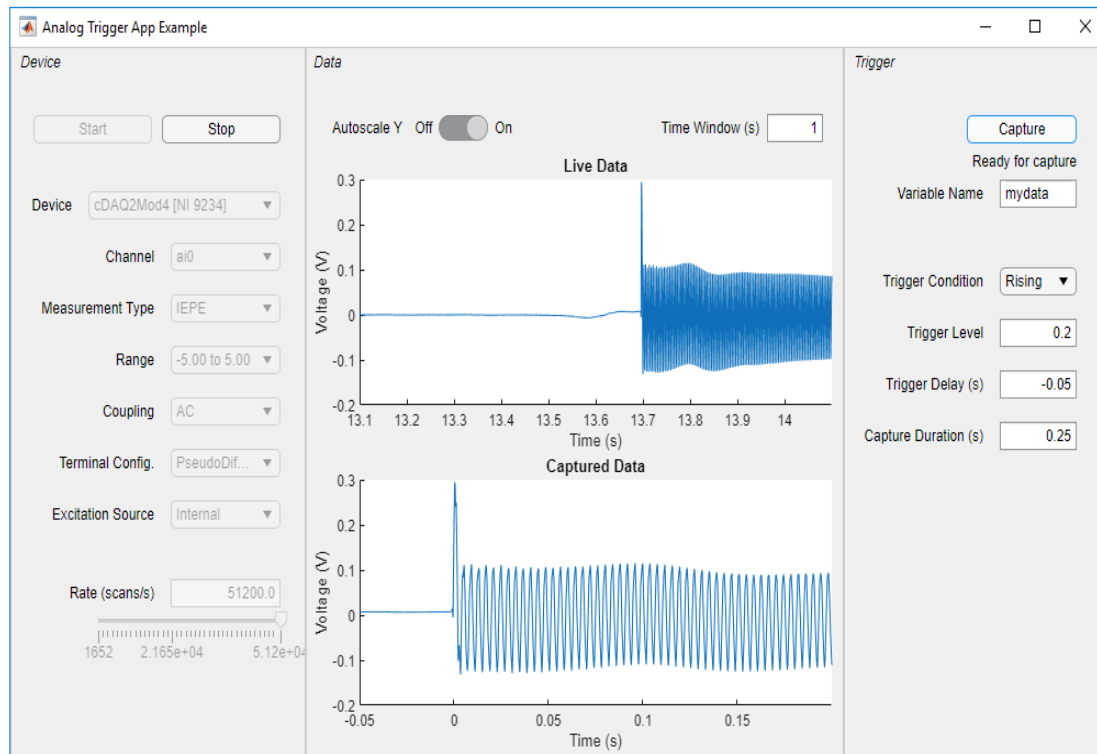

- Confirmed torque sensor error at low temperature

Sample No.	ECU Voltage (V)	Sensor error (Boolean)	Result
Criteria	12~15	0	-
#1	13.4	0	OK
#2	13.7	0	OK
#3	13.5	0	OK
#4	13.5	1	NG
#5	13.6	0	OK
#6	13.5	0	OK

# Further Details on Solutions Adopted

- Data Acquisition Toolbox + Vehicle Network Toolbox
  - Monitoring DAQ, Trigger, and XCP signals for analyzing Analog and XCP data

**Data Acquisition Toolbox**

**NI DAQ Board**

# Conclusion

- **Challenges**
  - Challenges in Test and Verification Due to Electrification of Mechanical Products Complexity, Reliability, and Cost Issues
  
- **Solutions**
  - Utilizing XCP Communication for Monitoring CAN Signals in Products
  - Analyzing Occurrence Time and Causes through Continuous 24-Hour Real-time Logging
  - Cost-effective Solution with In-House Program Coding and Enhanced Convenience through MATLAB Integration
  
- **Results**
  - Monitoring ECU via XCP for Temperature, Torque, Angle, and Current facilitated issue resolution and prevention
